

Describe what you want in plain English. Get a real, working application — live, looked after, and built to be trusted.

Every company needs software. Almost none of them can build it.

Find a co-founder

Give away part of the company, and hope the right person says yes.

Hire an agency

Six figures and six months before anyone sees a screen.

Use a cheap AI tool

Looks like an app, right up until a real customer arrives.

THERE IS NOW A FOURTH OPTION

01 You describe it In plain English. No technical brief, no specification to write.	02 We build it A working application — or an AI agent — on the internet, with real logins and real data.	03 We keep it running Watched, updated, backed up, and ready for the day it gets busy.
---	--	--

ENTERPRISE-GRADE, FROM THE FIRST LINE

Secure Locked down by default, not bolted on later.	Compliant Built for the day a security team asks.	Reliable It stays up, and someone is watching.	Scalable Ten users or ten thousand. Same app.	Efficient You pay for what you use, not for a team.
---	---	--	---	---

Anyone can build you an application. The hard part is keeping it alive — and that is the part we sell.

BUILT FOR INCUBATORS AND ACCELERATORS

You already give your startups lawyers, capital and introductions. The one thing you cannot give them is someone who can build. Now you can.

Next on the roadmap: formal certification, code ownership, and deployment into your own cloud.
